TITLE: Theory of detecting radio-frequency signals by the virtual cathode in the reflection space

SOURCE: Radiotekhnika i elektronika, v. 8, no. 5, 1963, 791-799

TOPIC TAGS: reflex klystron, detection with reflex klystron

ABSTRACT: In a previous article by A. I. Kostenko et.al. (Radiotekhnika i elektronika, 1959, 4, 3, 482), it was experimentally shown that r-f signals can be detected by the virtual cathode in the reflection space of a reflex klystron. The maximum detection was observed near the vanishing point of the virtual cathode. A mathematical theory of this phenomenon is offered in the article, the limiting assumption being that the signal duration considerably exceeds the electron transit time in the reflection space. The effect of detector operating conditions on detector current, which was observed experimentally, is explained in qualitative terms. Orig. art. has: 26 equations and 3 figures.

E071/E433AUTHORS: Klokman, V.R., Myakishev, K.G. and Smirnov, V.S.TITLE: A study of the influence of the formation of complexes in the molten state on the coefficient of crystallization in the systems  $PbCl_2$ - $ThXCl_2$ - $KCl$  and  $CaCl_2$ - $CdCl_2$ - $KCl$ 

PERIODICAL: Radiokhimiya, 1960, Vol.2, No.2, pp.175-182

TEXT: In previous works on the influence of the nature of solvents on the coefficient of crystallization of radium in nitrate and chloride systems, the authors expressed a supposition (Ref.2: Radiokhimiya, 1, 1, 26 (1959)) that in melts, as in solutions, the formation of complex ions of a macrocomponent in the liquid phase should lead to an increase in the coefficient of crystallization of a microcomponent. In order to confirm this supposition it was necessary to investigate systems in which the existence of complex ions in the liquid state was proved by other methods. For this purpose the authors chose two systems  $PbCl_2$ - $KCl$  and  $CaCl_2$ - $KCl$ . A review is given of literature on the dependence of physico-chemical properties on the composition of melts of the above two systems, proving the existence of complex compounds. In the present work the coefficients of crystallization ( $D$ ) of  $ThXCl_2$  in Card 1/4

X

A study of the influence ...

the system  $PbCl_2-KCl$  and  $CdCl_2$  in the system  $CaCl_2-KCl$ , at various temperatures and compositions of the liquid phase were determined in order to prove the dependence of  $D$  on the presence of a complex compound of the macrocomponent in the melt. Specially purified starting salts ( $PbCl_2$ ,  $KCl$ ,  $CaCl_2$ ) and radium isotope  $ThX$  and radioactive  $Cd^{115}$  (the purity of which was checked by the decay curves) were taken for the experiments. The experimental procedure was described earlier (Ref.2 and Ref.4: Radiokhimiya, 1, 5, 514 (1959)). The coefficient of crystallization of radium was determined at 430 and 450°C with the composition of melts 80 and 85 mole % of  $PbCl_2$  respectively. It was found that at a constant temperature and composition of the melt, the coefficient of crystallization  $D$  is independent of the amount of separated solid phase. With decreasing temperature and correspondingly with increasing content of potassium chloride in the liquid phase, the coefficient of crystallization increases from 0.93 at 450°C to 1.31 at 430°C, i.e. with a change in the temperature of 20°C the value of the coefficient changed by 40%. The determination of the coefficient of crystallization of cadmium chloride was done at 650, 667 and 685°C. Blank experiments were

Card 2/4

S/186/60/002/002/007/022

E071/E433

A study of the influence ...

carried out in order to correct for the volatilization of CdCl<sub>2</sub>. At a constant temperature and composition of the melt the crystallization coefficient of CdCl<sub>2</sub> is independent of the amount of the precipitated solid phase. With decreasing temperature, i.e. with increasing content of potassium chloride in the solid phase, the coefficient of crystallization increases from 0.30 at 685°C to 0.39 at 650°C, i.e. by 30% for 35°C. The authors also attempted to determine the coefficient of crystallization of KCdCl<sub>3</sub> in the system KCaCl<sub>3</sub>-KCl at temperatures 663 and 717°C. The coprecipitation of the cadmium compound with the corresponding calcium compound was not observed. The absence of cocrystallization of KCdCl<sub>3</sub> with KCaCl<sub>3</sub> could be explained either by the fact that the above two compounds are not isomorphic or that at the experimental temperature, which was about 270°C above the melting temperature of KCdCl<sub>3</sub>, the latter was completely decomposed. However, the possibility that the cocrystallization had occurred, but the coefficient of crystallization was so small that it was beyond the limit of the accuracy of measuring methods used, is not excluded. It is concluded that on the basis of the above results

A study of the influence ...

on the distribution of  $\text{ThXCl}_2$  and  $\text{CdCl}_2$  between the melt and crystals of  $\text{PbCl}_2$  and  $\text{CaCl}_2$  respectively, it was demonstrated that in the same way as for solutions, the formation of a complex compound of a macrocomponent in the liquid phase leads to an increase in the value of the coefficient of crystallization. There are 2 figures, 5 tables and 26 references: 18 Soviet-bloc and 8 non-Soviet-bloc. TITLE: Influence of the flux nature on the formation of abnormal mixed  $\text{CaF}_2$  sub  $2\text{-CeF}_3$  sub 3 and  $\text{CeF}_3$  sub 3-YF sub 3 crystals

SOURCE: Radiokhimiya, v. 5, no. 6, 1963, 649-655

TOPIC TAGS: mixed crystals, calcium fluoride, cerium fluoride, yttrium fluoride, calcium chloride, lithium fluoride

ABSTRACT: The present article is a development of earlier work by Klokman et al. (ZhNKh, 3, 1, 33 (1958), Radiokhimiya 2, 5, 521 (1961), ibid. 2, 2, 175 (1960), ibid. 1, 3, 241 (1959)) treating the same subject as applied to other similar compounds. The new series of tests substituting LiF for NaF in the binary melt with  $\text{CaF}_2$  showed no substantial change in the crystallization coefficients with respect to time and temperature. On the other hand, substitution of  $\text{CaCl}_2$  for NaFl showed a marked difference in this respect.

Card 1/3

ACCESSION NR: AP4009945

The following conclusions are made. In a  $\text{CaF}_2\text{-CaCl}_2$  system, unlike the purely fluoride systems  $\text{CaF}_2\text{-NaF}$  and  $\text{CaF}_2\text{-LiF}$ , the distribution of Ce and Y fluorides follows Khlopin's law, i.e., crystallization coefficient D remains constant independently of the amount of solid phase formed, of experimental conditions and time. The distribution of Ce and Y fluorides among the  $\text{CF}_2$  melt and crystals in a  $\text{CaF}_2\text{-CaCl}_2$  system is uninfluenced by gas environment because of poor gas solubility in the melt of this system. Rising crystallization coefficients of Ce and Y fluorides in  $\text{CaF}_2\text{-CaCl}_2$  at decreasing temperatures can be explained by the attenuated activity of macro-component ions because of decreasing dissociation of the complex  $\text{CaF}_2\text{-CaCl}_2$  compound. The general rule is formulated that crystallization coefficient D remains unchanged despite changes in the liquid phase if the concentration ratio of active macro- and micro-component ions is unchanged. On the other hand, if a change in the liquid phase results in decreased activity of macrocomponent ions - then D increases; conversely, D decreases if the activity of micro-component ions decreases. Orig. art. has 2 figures, no formulas, 5 tables.

 The solution of integro-differential ... C111/C333

which satisfies the conditions  $u|_{t=0} = \psi(x)$ ;  $\alpha_1 u + \alpha_2 \frac{\partial u}{\partial x}|_{x=a} = \beta_1 u + \beta_2 \frac{\partial u}{\partial x}|_{x=b} = 0$ . It is assumed that uniformly convergent series expansions

$$h(x, t, z, s) = \sum_{n=1}^{\infty} c_n(t, z, s) X_n(x),$$

$$f(x, t) = \sum_{n=1}^{\infty} \delta_n(t) X_n(x), \quad q(x) = \sum_{n=1}^{\infty} \omega_n X_n(x),$$

are valid, and that these series can be differentiated term by term twice with respect to  $x$  and once with respect to  $t$ ; the differentiated series converge uniformly. Here  $X_n(x)$  are the eigenfunctions of the boundary value problem to which the Fourier method is leading.

TITLE: Some anomalies of average monthly air temperatures

SOURCE: Mirovoy meteorologicheskiy tsentr. Trudy, no. 9, 1966. Statisticheskiye svoystva meteorologicheskikh poley (Statistical properties of meteorological fields), 3-17

TOPIC TAGS: air temperature, temperature measurement, temperature variation

ABSTRACT: A specific indicator for the anomaly of average monthly air temperatures is proposed. Numerical values for the criterion of anomaly

$$K = \frac{1}{N} \sum_{n=1}^N \frac{A_n^2}{\sigma_n^2}, \quad (1)$$

are presented for 1901--1960,  $A_n$  being the anomaly and  $\sigma_n$  the dispersion of anomalies in some points distributed over a given area. The data are derived from 40 observation points in the European and Siberian Soviet Union for the months of July and January. The specific values of the covariational matrix, their information value, and the first five eigenvectors have been derived by machine computation and tabu-

TITLE:

Electrical resistivity of  $V_2O_5$ ,  $MoO_3$ , and  $WO_3$  when heated in hydrogen atmosphere

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 7, 1962, 1524 - 1527

TEXT: The initial stage of the reaction of  $V_2O_5$ ,  $MoO_3$ , and  $WO_3$  with  $H_2$  was studied by measuring the electrical resistivity (apparatus see Izv. vyssh. uchebn. zavedeniy, Chernaya metallurgiya, no. 7, 1961). Oxides sintered in an  $O_2$  flow for 6 hr were used. At all temperatures applied ( $200 - 700^\circ C$ ), resistivity was found to diminish in the course of heating.  $\Delta R/R\Delta T$  for  $V_2O_5$  was 0.002 at  $250^\circ C$ , 0.004 at  $300^\circ C$ , 0.007 at  $350^\circ C$ , 0.016 at  $375^\circ C$ , and 0.027 at  $380^\circ C$  (start of reaction with  $H_2$ ). For  $MoO_3$  and  $WO_3$ ,  $\Delta R/R\Delta T$  rose slowly at low temperatures, and rapidly near the beginn-

Card 1/2

ing of reaction with  $H_2$  ( $430^\circ C$  for  $MoO_3$ ,  $630^\circ C$  for  $WO_3$ ). The slow rise corresponds to the extrinsic conductivity of the oxides with chemisorbed  $H_2$  reacting as donor with the oxide, while the steep rise of the curve is due to the changeover to intrinsic conductivity. Here, an intense reaction with  $H_2$  starts in the gaseous phase owing to sublimation (dissociation) of the oxide. There are 4 figures and 1 table.

## TITLE:

The Experimental Determination of the Power of the Submillimeter Range in a Magnetic Undulator

## PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol 131, Nr 1, pp 61 - 63  
(USSR)

## ABSTRACT:

The present paper describes the preliminary results obtained by determining the summational mean power of the electromagnetic oscillations<sup>1)</sup> of the submillimeter range. The power to be determined is emitted by relativistic 17 Mev electrons in a magnetic undulator. With an average electron amperage of 4  $\mu$ a,  $\sim 10^{-7}$  w was obtained for the level of the mean power. The production of a radiation in the tenth-of-a-millimeter range and in the submillimeter range is of great practical interest. Such electromagnetic oscillations can at present be produced only by means of spark generators and heated bodies. However, the power levels obtained in this way are very low. The undulatory method of producing high-frequency oscillations, which is based upon ✓

using the double Doppler-effect of frequency transformation, makes it possible to bridge the entire range of electromagnetic oscillations from 1 mm to visible light. The level of the emitted power may actually be made sufficiently large, even in the case of an incoherent radiation. For the frequency of radiation in a magnetic undulator for the free space  $\nu = v/[l_0(1 - \beta \cos \theta)]$  holds. Here  $v$  denotes electron velocity,  $l_0$  - the period of magnetic structure;  $\beta = v/c$ ;  $\theta$  - the angle between the direction of motion and the direction towards the observer. The production of electromagnetic oscillations may, in a sufficiently wide frequency-range, be determined by measuring electron energy (with constant  $l_0$ ). The undulator used in the present paper consists of separate electromagnets, in which it was possible to eliminate completely the harmful components of the magnetic field. 90% of the input amperage passed through the entire undulator. With the wave guide dimensions used here, a discrete spectrum of electromagnetic oscillations was obtained because of the difference of the excited oscillations. This spectrum is subdivided into the two principal ranges of 100 to 250  $\mu$  and

Card 2/4

68805

50 to 67  $\mu$ . The main part of the lines produced is in the latter range. At present, measurements of the entire power of radiation of the entire spectrum investigated are being carried out, and preparations are made for recording the spectrum. Figure 1 shows the scheme of the device. The elimination of background is briefly dealt with. The power of electron radiation in the undulator is proportional to  $H^2$ , and therefore  $\frac{P(H_1)}{P(H_2)} =$

$= \frac{H_1^2}{H_2^2}$  holds. Herefrom and from another equation it is possible

to calculate the absolute amount of radiation intensity for a given magnetic field. The results obtained by the measurements are given in table 1. The authors thank K. D. Sinel'nikov, Academician of the AS UkrSSR, for the suggested theme, and Ya. B. Faynberg for discussing the results obtained. There are 1 figure, 1 table, and 3 references.

Abstract : On completely cleared areas in dry pine forests, pine-bilberry forests, and forests of the whortleberry and club moss types (Leningrad oblast'), natural reproduction proceeds with great difficulty. Investigations of completely cleared areas in the Luga, Tikhvin, Orodzh, Siversk, and Lisinsk forest economies have established that surface loosening of the soil has a positive effect on self-seeding when the cover is sparse and there is

TITLE: Cladding of steel with niobium by vacuum rolling

SOURCE: Tsvetnyye metally, no. 12, 1966, 88-89

TOPIC TAGS: metal cladding, niobium clad steel, clad steel production

## ABSTRACT:

Niobium-clad steel sheets were produced by rolling packs consisting of a St. 3 steel plate (9—12 mm thick) and a VH-2 niobium sheet (2 mm thick) in a vacuum ( $4 \cdot 10^{-5}$  mm Hg) mill equipped with steel rolls, 166 mm in diameter, at 900—1200°C with per pass reductions of 10—40%. The width of packs was 50 mm and the length was 140 mm. It was found that the strength of the bond between the clad and base metals increased with increasing rolling temperature. The shear strength was  $100 \text{ Mn/m}^2$  ( $10 \text{ kg/mm}^2$ ) after 30% reduction at 900—1000°C, and after the same reduction at 1100—1200 it was  $210—230 \text{ Mn/m}^2$  ( $21—23 \text{ kg/mm}^2$ ). The bond strength also increased with

Card 1/2

UDC: 669.293,14-419

ACC NR: AP7002847

increasing per pass reduction. After 10% reduction at 1100C it did not exceed 100 Mn/m<sup>2</sup> (10 kg/mm<sup>2</sup>), and after 30—40% reduction it reached 250 Mn/m<sup>2</sup> (25 kg/mm<sup>2</sup>). However, high per pass reduction leads to a non-uniform deformation of the layers. Therefore, to ensure a reliable bond and more uniform deformation, it is advisable to roll at 1100—1200C, with 10—15% reduction per pass and 30—40% total reduction. [TD]

**TITLE:** Influence of the asymmetry of the frequency characteristic of the circuit on the distortion of a frequency modulated signal

CITED SOURCE: Tr. uchebn. in-tov svyazi. M-vo svyazy SSSR, vyp. 19, 1964, 64-73

TOPIC TAGS: fm signal, modulation, distortion, Fourier coefficient

TRANSLATION: Passage of frequency modulated oscillations  $u = \sin(\omega_0 t + m \sin \tau)$  through a linear circuit produces an oscillation whose instantaneous frequency can be represented by a Fourier series. Comparatively simple formulas are given for the calculation of the coefficients of this series for low modulation indices, with account of the asymmetry of the characteristic of the circuit relative to the signal carrier frequency.

It is possible to readily estimate with these formulas the frequency and nonlinear distortion of the frequency modulation.

TITLE: Dependence of adsorptive catalytic desulfurization of diesel fuel on a catalyst surface

SOURCE: AN SSSR. Bashkirskiy filial. Khimiya seraorganicheskikh soedinenii,  
soderzhashchikh v naftyakh i nefteproduktsakh, v. 7, 1964, 200-204

TOPIC TAGS: desulfurization, catalyst, adsorption, diesel fuel, surface active agent, sulfur, hydrocarbon/ silica gel, KSM silica gel

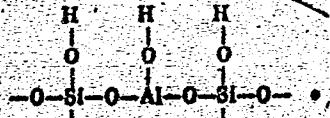

ABSTRACT: The relative activities of various catalytic agents and adsorbents in adsorptive-catalytic purification of diesel fuels from organic sulfur compounds were studied experimentally. The specific adsorption surfaces and their pore sizes were determined by the adsorption isotherms of various hydrocarbons and organic acids. The adsorbent-catalysts were mostly aluminosilicates, an alumogel, a silica gel, and bauxite. For synthetic as well as natural aluminosilicates, the specific desulfurization rate remained constant. The specific activity of bauxite was high, but that of the alumogel and the silica gel were low. It was shown that

the major role played by the aluminosilicate catalysts in diesel fuel desulfurization could be attributed to the complex

During desulfurization, coke and other organic sulfur compounds were deposited on the surface of the catalyst and reduced the effective catalytic area. This requires special regeneration of the contaminated surfaces. Orig. art. has: 2 tables, 1 figure, and 1 formula.
